                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from fragment is 1 of 24 rpoB gene fragments can be used various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method comprises obtaining a restriction fragment length polymorphism (RRLD) pattern of the 24 rpoB gene fragments: isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RRLD patterns from the Known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical tests. Also described are oligonucleotide probes (AAS05227-AAS05242) for
                                                                                                                                                                                                                                                                                                                                    ö

The present sequence for Mycobacterium kansasii rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) (method. The method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments of are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including W. tuberculosis, M. leprae and non-tuberculosis mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HTV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical districtive proving analysis of the rests. Also described are oligonuclectide probes (AAS05227-AAS05242) for darentian analysis of the rests.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                   The present sequence for Mycobacterium avium rpoB gene
fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from
various Mycobacterial species. These rpoB gene fragments can be used
in the diagnosis and identification of Mycobacterium species using a
novel PCR-restriction fragment length polymorphism analysis (PRA)

cc method. The method comparises obtaining a restriction fragment length

cc method. The method comparing the DNA fragment from the microorganism to

bolymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating,

amplifying and digesting the DNA fragment from the microorganism to

cc be identified and comparing the RFLP patterns from the known rpoB gene

cc fragments with the unidentified fragment. The rpoB gene fragments

cc fragments with the unidentified fragment. The rpoB gene fragments

cc diagnosis or to obtain epidemalological and pathogenesis information for

cs election of appropriate therapies, including M. tuberculosis, M. leprae

and non-tuberculous mycobacteria (MTM) encountered in subjects infected

cc with human immunodeficiency virus (HIV). Analysis of the rpoB gene

cc with human immodeficiency virus (HIV). Analysis of the rpoB gene

cr required, and can differentiate between many species in a single

cc experiment, including those difficult to distinguish by usual blochemical

cc rests. Also described are oligonucleotide probes (AASO5227-AASO5227) for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The present sequence for Mycobacterium fortuitum rpoB gene fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO524) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to comparing the RFLP patterns from the microorganism to comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments with the unidentified fragment. The rpoB gene fragments or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including N. tuberculosis, M. leprae and non-tuberculous mycobacteria (NFM) encountered in subjects infected fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical detecting shorific Mycobacterial generates (ABSO5227-AASO5242) for detecting shorific Mycobacterial are oliginated per observed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 GCCTGAACACCGCGTCCCCGATCACGACGACCTCTGACCGAAGAGGACGTCGTCGCCA 120

The present sequence for Mycobacterium gordonae type I rpoB gene fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from 20 various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method. The method comprises obtaining a restriction fragment length comprises obtaining a restriction fragment length amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RPLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments with the unidentified fragment. The rpoB gene fragments of diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae cand non-tuberculosus mycobacteria (NTM) encountered in subjects infected the brown views (NTM) and manifered to the control of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for

The present sequence for Mycobacterium marinum rpoB gene fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5204) from various Mycobacterial species. These rpoB gene fragments can be used to the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method comprises obtaining a restriction fragment length colymorphism (RFLP) pattern of the 24 rpoB gene fragments length polymorphism (RFLP) pattern of the 24 rpoB gene fragments is isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments con a useful to identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentify a wide range of Mycobacterium species, e.g. for a selection of appropriate therapies, including M. tubberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected tagments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single capteriant should are oligonuclectide probes (AASO5227-AASO5242) for cherent and sometian energial and searched are oligonuclectide probes (AASO5227-AASO5242) for cherent in a service continual and cost from the service of the propes of the probes (ABSO5227-AASO5242) for cherent in a service continual and cost from the service of the probes (ABSO5227-AASO5242) for cherent in the service of the probes of the probes
                                                                                                                                                                                                HIV; PRA; RFLP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 GCCIGAACACCGCGTCCCCGATCACGACGACCACTCTGACCGAAGAGGACGTCGTCGCCA 120

The present sequence for Mycobacterium xenopi rpoB gene fragment is 1 of 24 rpoB gene fragments (AASO5201-AASO5224) from various Mycobacterial species. These rpoB gene fragments can be used to the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments; Isolating, amplifying and digesting the DNA fragment from the microorganism to De identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments come serial to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (MTM) analysis of the rpoB gene continued to a precise, simple and cost effective (only 1 pcR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical correction of escribed are oligonuclectide probes (AASO5227-AASO5242) for deferring analysis of the ropes (estering analysis of the ropes). Non-tuberculous mycobacteria; rpoB gene fragment; NTM; HIV; PRA; RFLP; PCR-restriction fragment length polymorphism analysis; ds. New DNA fragments from the rpoB gene of mycobacteria, useful f diagnosis and identification of many mycobacterial species by restriction fragment length polymorphism Park HJ; Kim Y, s, detecting specific Mycobacterial species. New DNA fragments from the rpoB gene of mycobacteria, useful for diagnosis and identification of many mycobacterial species by restriction fragment length polymorphism

Claim 1; Page 41; 50pp; English.

The present sequence for Mycobacterium gordonae type III rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05204) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including withberculosis, M. leprec and non-tuberculous mycobacteria (NTM) encountered in subjects infected fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical deferentian encountered are oligonuclectide probes (AAS05227-AAS05242) for deferentian encountered are oligonuclectide probes (AAS05227-AAS05242) for detecting specific Mycobacterial species.

These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DRA fragment from the microorganism to be identified and comparing the RFLP patterns from the Rnown rpoB gene fragments with the unidentified fragment. The rpoB gene fragments with the unidentify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical tests. Also described are oligonucleotide probes (AAS05227-AAS05242) for detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Non-tuberculous mycobacteria; rpoB gene fragment; NTM; HIV; PRA; RFLP; PCR-restriction fragment length polymorphism analysis; ds.

The present sequence for Mycobacterium tuberculosis rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from fragment is 1 of 24 rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (NTM) encountered in subjects infected with human immunodeficiency virus (HIV). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR

ö
required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual blochemical tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence for Mycobacterium terrae rpoB gene fragment is 1 of 24 rpoB gene fragments (AAS05201-AAS05224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism (PRLP) pattern of the 24 rpoB gene fragment length polymorphism (RRLP) pattern of the 24 rpoB gene fragment; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RRLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments

are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (MTM) encountered in subjects infected with human immunodeficiency vitus (HTM). Analysis of the rpoB gene fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Non-tuberculous mycobacteria; rpoB gene fragment; NTM; HIV; PRA; RFLP; PCR-restriction fragment length polymorphism analysis; ds.

novel PCR-restriction fragment length polymorphism analysis (PRA)
method. The method comprises obtaining a restriction fragment length
polymorphism (RFLP) pattern of the 24 rpoB gene fragments; isolating,
amplitying and digesting the DNA fragment from the microorganism to
be identified and comparing the RFLP patterns from the known rpoB gene
fragments with the unidentified fragment. The rpoB gene fragments
crangeness with the unidentified fragment. The rpoB gene fragments
can useful to identify a wide range of Mycobacterium species, e.g. for
diagnosis or to obtain epidemiological and pathogenesis information for
selection of appropriate theraphes, including M. tuberculosis, M. Leprae
and non-tuberculous mycobacteria (MTM) encountered in subjects infected
with human immunodeficiency virus (MTW). Analysis of the rpoB gene
fragments is rapid, precise, simple and cost effective (only 1 PCR
required), and can differentiate between many species in a single
experiment, including those difficult to distinguish by usual biochemical
                                                                                                                                                                                                                     ö

```

```
This oligonucleotide DNA primer is specific for Mycobacterium tuberculosis, and may be used to amplify a sample DNA by targeting a portion of the gene encoding rope. The lst several bases comprise a nonhybridizing tail consisting of filler bases followed by a restriction site incorporated to facilitate cloning using the amplicon at a later date, if desired. The remaining bases hybridize to bacterial rope DNA. The method provides for the detection of M. tuberculosis and the concurrent determination of its drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detection of Mycobacterium tuberculosis - by amplifying sample DNA with a primer set that targets portions of the gene encoding rpoB.

Polynucleotide sequences AAH51947 - AAH52092 represent DNA encoding proteins AAGB1096 - AAGB1241, Mycobacterium tuberculosis proteins which are potential drug targets. The DNA and protein sequences are used to illustrate the method of the invention. The method involves providing an unknown nucleotide or polypeptide sequences, and comparing it to a number of sequences along with at least one

The method comprises amplifying the nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                used to identify and detect the presence of algal, fungal and parasitical species in a test sample -
algorithm capable of analysing a functional relationship between nucleotide and polypeptide sequences. The method is useful for characterising the function of nucleic acids and polypeptides that may useful as a target for \epsilon drug or essential for the growth or viability

cc species with a combination of defined primer pairs. The method can be species with a combination of defined primers for detecting one or more related microorganisms e.g. algae, archaea, bacteria, fungi and parasites, for universal detection and for specific and ubiquitous contained using the method of an algal, archaeal, bacterial, fungal and parasitical species, genus, family and group. A nucleic acid (I) and parasitical species, genus, family and group. A nucleic acid (I) cobtained using the method of the invention can be used for the universal detection of at least one antimicrobial agent resistance gene or at least one toxin gene. hexa nucleic acids are used for the specific and upduitous detection and for identification of Streptococcus pneumoniae. (I) can be used to design a therapeutic agent which is effective against microorganisms. Microbial species or genus or family or phylum or group control and be detected include Abhiotrophia adiacens, Bordetella sp., CC (I) can be used to design a therapeutic agent which is effective against microorganisms. Microbial species or genus or family or phylum or group convices faster results than substrate specificity tests as results can be determined in an hour and improved accuracy is also achieved.

CC MAH00010 to AAH002304 represent nucleotide sequences and primers/probes convices faster results than substrate specificity tests as results can be determined in an hour and improved accuracy is also achieved.

AAH00010 to AAH002304 represent nucleotide sequences and primers/probes convices faster results than substrate specificity tests as results can be determined are given in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Details of M. tuberculosis sequencing at the Sanger Centre are available on the World Wide Web.

(URL, http://www.sanger.ac.uk/Projects/M_tuberculosis/) CDS have been renumbered from the original cosmid submissions but the old gene designations are in brackets after the new gene numbers. Gene prediction was based on a Hidden Markov Model of TB genes implemented in TBparese (Krogh) supplemented with visual inspection of positional base preference in codons, especially where there is an increase in the Observed/expected third position G + C. CAUTION: In some cases we may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg., gtg., or ttg) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream

/note="0rgan: juvenile vegetative shoots; Vector:
pAb-GA14-2.1: Site_1: ECORI; Site_2: Xhoi; Equal amounts
of total RNA by weight from 4 tissue sources (see below)
were pooled, polyA+ RNA isolated, and cDNA synthesized for
ECORI (5') and Xhoi (3') directional cloning into lambda
Hybrizap vector from Stratagene. Tissue Sources: 1. Whole
shoots 3 days after sowing/imbibing in wet soil: 2. Basal
1.5 cm shoots 6 days after sowing - includes yellow
portions of developing leaves 1-5, primordia from 6-8, and
the vegetative apex. 3. Non-green portions of developing
leaves 4-5 and the vegetative apex, including adult leaf
primordia, 9 days after sowing. 4. Partially expanded and
greening leaves 4-5 at 13 days after sowing."

Overall sequence quality assessment and vector trimming were conducted using the Lucy software (<a href="http://www.tigr.org/softlab/">http://www.tigr.org/softlab/</a>). Lucy parameters were set to ensure an overall trimmed quality of 97.5% or better without any vector fragments in the chosen high-quality region of each sequence. Low-quality bases between the poly-T and the high-quality region were replaced with N's to serve
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                              (*http://depts.washington.edu/ventures/collabtr/direct/index.htm>#b rt). Overall sequence quality assessment and vector trimming were conducted using the Lucy software (*http://www.tigr.org/softlab/>). Lucy parameters were set to ensure an overall trimmed quality of 97.5% or better without any vector fragments in the chosen high-quality region of each sequence. Low-quality bases between the poly-T and the high-quality region were replaced with N's to serve as spacers.

After the addition of EcoRI adaptors, the ds-cDNAS were digested with NotI and size-selected. The resulting molecules were directionally cloned into the EcoRI and NotI sites of the pT/T3PAC vector. The library then went through one round of normalization to CoT value of 5 based on the methods of Marcelo Bento Soares (Genome Research 6: 791-806, 1966)."

rt). Overall sequence quality assessment and vector trimming were
conducted using the Lucy software (<http://www.tigr.org/softlab/>).
Lucy parameters were set to ensure an overall trimmed quality of
97.5% or better without any vector fragments in the chosen
high-quality region of each sequence. Low-quality bases between the
poly-T and the high-quality region were replaced with N's to serve

Overall sequence quality assessment and vector trimming were conducted using the Lucy software (<a href="http://www.tigr.org/softlab/">http://www.tigr.org/softlab/</a>). Lucy parameters were set to ensure an overall trimmed quality of 97.5% or better without any vector fragments in the chosen high-quality region of each sequence. Low-quality bases between the poly-T and the high-quality region were replaced with N's to serve

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (*http://depts.washington.edu/ventures/collabtr/direct/index.htm>*brt). Overall sequence quality assessment and vector trimming were conducted using the Lucy software (<http://www.tigr.org/softlab/>). Lucy parameters were set to ensure an overall trimmed quality of 97.5% or better without any vector fragments in the chosen high-quality region of each sequence. Low-quality bases between the poly-T and the high-quality region were replaced with N's to serve

// Tissues: Germinated seed and seedlings (1, 2, 8, 11 DAG), Mixed mature tissures (17, 21, 38, 69, 77 DAG), Kernels (17, 5, 10, 15, 20, 25, 30, DAP), Adventious roots (65 DAG), Tassel (3-39 Cm, 53 and 56 DAG), Immature ear (0, 2-3.0 Cm, 53, 56, 59 DAG), Husk (73 DAG), Immature ear (0, 2-3.0 Cm, 53, 56, 59 DAG), Husk (73 DAG), Immature ear (0, 2-3.0 Cm, 53, 56, 59 DAG), Husk (73 DAG), Immature ear (0, 2-3.0 Cm, 53, 56, 59 DAG), Husk (73 DAG), Silk, unpollinated first ear, ear shank, etiolated seedlings, Cycloheximide-treated callus, Anaerobic treated seedlings, Kinetin-treated seedlings, ARC (1-aminocyclopropane-1-carboxylix acid)-treated seedlings, Brassinolide-treated seedlings, ARG (Abberellic acid)-treated seedlings, GA (Gibberellic acid)-treated seedlings, GA (Gibberellic acid)-treated seedlings, GA (Gibberellic acid)-treated seedlings, GA (Gibberellic acid)-treated seedlings described from oligo-dT selected mRNA by priming with a Notiological primer (5)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (<http://depts.washington.edu/ventures/collabtr/direct/index.htm>#b rt). Overall sequence quality assessment and vector trimming were conducted using the Lucy software (<http://www.igto.org/softlab/>). Lucy parameters were set to ensure an overall trimmed quality of 97.5% or better without any vector fragments in the chosen high-quality region of each sequence. Low-quality bases between the poly-T and the high-quality region were replaced with N's to serve as spacers.
                                                                                                                                                       Lea mays

                                                                                   VERSION
                                                                                                                                                                                                                                                                                                                                                     rt). Overall sequence quality assessment and vector trimming were conducted using the Lucy software (<http://www.tigr.org/softlab/>) Lucy parameters were set to ensure an overall trimmed quality of 97.5% or better without any vector fragments in the chosen high-quality region of each sequence. Low-quality bases between the poly-T and the high-quality region were replaced with N's to serve as spacers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         as a template for DNA PolI catalyzed second strand synthesis. After the addition of EccRI adaptors, the ds-cDNAs were digested with NotI and size-selected. The resulting molecules were directionally cloned into the EcoRI and NotI sites of the pT/T3PAC vector. The library then went through one round of normalization to CoT value of 5 based on the methods of Marcelo Bento Soares (Genome Research 6: 791-806, 1996).
                                                                                                                                                                                                                                                                                                                              (<http://depts.washington.edu/ventures/collabtr/direct/index.htm>#b

                                                                                                                                                                                                                                                                                                                                                                                                         resulting DNA:RNA hybrid was treated with RNASe H and used as a template for DNA Poll-catalyzed second strand synthesis. After the addition of EcoRI adaptors, the ds-cDNAs were digested with NoII and size-selected. The resulting molecules were directionally cloned into the EcoRI and NoII sites of the pT773PAC vector. The library then went through one round of normalization to CoT value of 5 based on the methods of Marcelo Bento Soares (Genome Research 6: 791-806, 1996).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           BM332944 651 bp mRNA linear EST 16-JAN-2002 MEST181-G09.T3 ISUM5-RN Zea mays cDNA clone MEST181-G09 3', mRNA

                                                                                                                                rt). Overall sequence quality assessment and vector trimming were conducted using the Lucy software (ehttp://www.tlgr.org/softlab/>). Lucy parameters were set to ensure an overall trimmed quality of 97.5% or better without any vector fragments in the chosen
first ear, ear shank, etiolated seedlings, callus, Cycloheximide-treated callus, Anaerobic treated seedlings, NAA (a-Naphthalene acetic acid)-treated seedlings, Kinetin-treated seedlings, ACPC
